How to setup and run the django server

see github page for more info (https://github.com/ryanmac666/IFB299-Team14-Repo)

Django requires python (preferably python3 but python2 should work) and pip to install. Django can be installed with the following command

```
pip install Django==1.10.1
```

Next the servers dependencies need to be install. This can be done using the following commands

```
pip install django-bootstrap3
pip install django-notifications-hq
```

Now with the dependences installed the django server can be started from the CommunityOrganization folder by running the following command

```
python manage.py runserver
```

Django should start a server at localhost on port 8000

```
http://127.0.0.1:8000/
```

or

```
http://localhost:8000/
```
